

BUSINESS PLAN & INVESTMENT CASE

An intelligence layer for essential field services

Predictive analytics and asset management for the distributed critical equipment that was never large enough to justify a control system.

Investment sought

\$1.05M equity

Prepared

2 August 2026

Contents

01	Why operators cannot keep running blind	Accountability rising, visibility flat
02	What the platform does	Monitor, predict, dispatch, prove
03	Positioning	The third way between a dialer and SCADA
04	Why now	Four drivers, ranked by force
05	Business model	Three revenue lines, deliberately weighted
06	Financial model	Bottom-up from partner and site counts
07	Customer acquisition	Where seventy partners come from
08	Competitive position	Against SCADA, dialers, and OEM apps
09	Status and risks	What exists, and what could break this
10	The ask	Use of funds, cash flow, and return

1. Why operators cannot keep running blind

Essential services do not get to fail quietly. When a lift station overflows, a treatment unit stops disinfecting, or a walk-in loses temperature, the outcome is a regulator, a public-health notice, or a customer lost — not a maintenance ticket.

Yet these are the assets nobody can see: too dispersed for a control room, too small for SCADA economics, and maintained by crews that shrink while the estate they cover grows.

The gap between what an operator is accountable for and what they can actually observe widens every year — and every one of those failures announced itself first, in current draw, in run time, in drifting chemistry.

PeakLogic closes that gap without asking anyone to become a SCADA operator. It reads the warning, decides what matters, and puts the work in front of the person who can act on it.

2. What the platform does

Four steps. Most competitors stop after the first, which is why an alarm reaches a phone and nothing else happens.

01 · MONITOR

Connect what exists

Pumps, blowers, chemistry, level, and refrigeration — mixed vendors, one platform, over cellular or the site's own network.

02 · PREDICT

Read the warning

Per-asset baselines catch degradation weeks before the failure it becomes.

03 · DISPATCH

Land the work

An alarm becomes a work order in the partner's own system, routed to whoever is accountable.

04 · PROVE

Keep the evidence

Compiled as it happens, not reconstructed from paper afterwards.

3. Positioning

For operators of distributed critical equipment — wastewater and septic, campus and assisted-living facilities, food service, pools, and light commercial mechanical — who **cannot justify a traditional SCADA deployment but cannot absorb the failures either**, PeakLogic is a predictive analytics and asset-management platform that converts unplanned failure into scheduled work.

Autodialers call once the overflow has happened. SCADA is priced and scoped as a capital project. PeakLogic reaches these sites a third way — **through the service contractors already maintaining them** — so it arrives with no integration project and pays for itself out of emergencies that no longer occur.

4. Why now

Four forces, ranked by how much of the market each moves. Only the second is time-boxed — but it determines whether these are the right twenty-four months.

01

MARKET CREATION, NOT DISPLACEMENT

At most of these sites, the incumbent is nothing at all

"Displacement" overstates it. The overwhelming majority of lift stations, treatment units, and light commercial mechanical rooms have **no monitoring at all, or a phone autodialer that calls once the failure has happened**. There is no vendor to unseat, no contract to buy out, and nothing to rip out.

That is the stronger position: no switching friction, no incumbent defending an account, and a buyer adopting for the first time rather than being asked to admit an earlier decision was wrong. Where we do displace, it is narrow — ageing autodialers, and OEM apps that see only their own manufacturer's equipment.

02

TIME-BOXED

Consolidation has orphaned the installer channel

DataFlow Systems, the dominant lift-station monitoring vendor, was acquired by SmartCover in 2023 and SmartCover by Badger Meter in 2025 for **\$185M**. The product line is folding into Badger's BlueEdge suite: contracts, billing, support contacts, and domains are all moving, and small-to-midsize lift-station work receives the least attention during an integration of that size.

This is both a displacement and a partnership opening, and the partnership half is durable.

Panel builders are the distribution channel, not the competition. They already sell to towns and operators, most of their panels still ship with a dialer or nothing, and they want recurring revenue without building cloud software.

03

STRUCTURAL

A modernisation cycle is arriving whether operators are ready or not

Three forces converge on one estate. The installed base of dialers and relay panels is **reaching end of life** just as the cellular and sensing hardware to replace it has fallen to a fraction of its former cost. Meanwhile the workforce that carried this knowledge in their heads is retiring, and the crews replacing them are smaller and cover more sites.

An operator is asked to supervise a growing estate with fewer people and ageing instrumentation — and increasingly to **evidence** that they can. Modernisation stops being discretionary at that point; the question becomes what they modernise onto.

04

NOW A PROCUREMENT GATE

Security has moved from a checkbox to a condition of sale

The 2026 coordinated intrusions against US water utilities changed what a security review is for. Legacy dialers and one-off panels have no posture to present: no patching story, no audit trail, no answer to what a compromised device could reach. Regulators, insurers, and boards now ask, and most operators cannot answer.

Today the platform is read-only by construction — no code path issues a device command. **Control is on the roadmap**, because operators will want remote reset and shutoff. The advantage is the order in which we build: the authorisation model, safety interlocks, and audit trail are designed before any command path exists, and safety-critical trips stay local to the equipment. Every incumbent is attempting the reverse.

5. Business model

LINE	WHO PAYS	PRICE	ROLE
Partner platform fee	Service company	\$250–\$4,000/mo by fleet size	The durable line. Buys a business system — dispatch, work orders, a branded customer portal, compliance evidence.

LINE	WHO PAYS	PRICE	ROLE
Channel monitoring	Partner, marked up to their customer	\$22/site/mo	Scales with the partner's own book, resold inside contracts they already hold.
Direct monitoring	Site owner, sold by us	\$38/site/mo	No partner margin to share. Higher acquisition cost, and the source of reference customers.
Hardware & commissioning	Site owner	~\$1,800/site	COST-PLUS, ~20% Deliberately not a profit centre — an acquisition cost we recover.

Institutional campuses at ~\$25K/yr are always sold direct. Direct accounts for roughly 39% of recurring revenue across the plan.

A site owner buys monitoring once, reluctantly, and churns when budgets tighten. A service company buys it to **protect margin on contracts they already hold** — fewer emergency callouts, fewer wasted visits, evidence when a customer disputes work. That is an operating decision, and it renews.

6. Financial model

Built from partner and site counts against published pricing. Every figure is arithmetic from those two inputs — no top-down market-share assumption.

RECURRING / SITE \$264 channel · \$456 direct	HARDWARE / SITE \$1,800 one-time, ~20% margin	SITES / PARTNER ~90 at maturity	YEAR-5 ARR \$3.75M 70 partners · 8,000 sites
---	---	---	--

Revenue and recurring run-rate

Recurring revenue is recognised on the average of opening and closing base, not the exit run-rate — the most common way early-stage models overstate year one.

YEAR	PARTNERS	SITES	OF WHICH DIRECT	EXIT ARR	REVENUE	GROSS PROFIT
Year 1	3	150	30	\$97K	\$319K	\$94K
Year 2	8	600	120	\$328K	\$1.02M	\$337K

YEAR	PARTNERS	SITES	OF WHICH DIRECT	EXIT ARR	REVENUE	GROSS PROFIT
Year 3	20	1,800	350	\$922K	\$2.79M	\$945K
Year 4	40	4,000	800	\$1.97M	\$5.41M	\$1.98M
Year 5	70	8,000	1,600	\$3.75M	\$10.06M	\$3.78M

Revenue mix, and why gross profit is the better measure

Revenue is hardware-heavy early — only 21% of year-3 revenue is recurring, because every new site carries ~\$1,800 of equipment. Presented as SaaS, that would mislead. So the plan reports **gross profit mix instead**: hardware runs at ~20% margin and software at ~82%, which means recurring gross profit overtakes hardware in **year 2** and reaches 60% by year 5 and 81% by year 8. Revenue makes this look like an equipment business; profit shows it is not.

Is 8,000 sites deliverable?

As a single number it reads like more than one installation every working day. The correct unit is per partner, per week.

YEAR	CHANNEL SITES ADDED	PARTNERS	PER PARTNER / YEAR	PER PARTNER / WEEK
Year 1	120	3	40	0.83
Year 2	360	8	45	0.94
Year 3	970	20	49	1.01
Year 5	3,200	70	46	0.95

48 working weeks. Channel sites only — partners install those on visits already scheduled. The direct book is installed by us and is an order of magnitude smaller.

Slightly under one site per partner per week, every year, and it never rises. The number looks large only because it is the sum of many small independent efforts, which is what the channel model is for. The real risk is not installation capacity — it is partner recruitment.

7. Customer acquisition

Eight partners by month 24 and seventy by year five is the number that carries the plan. Here is where they come from.

CHANNEL	PARTNERS BY YR 5	ROUTE IN	WHY THEY SAY YES
Affiliate operator	1	Already held. First fleet live in month 3.	No sales cycle. Produces the case studies every other conversation needs.
Control-panel builders	25–30	Direct outreach to shops serving wastewater and light commercial, concentrated where lift-station density is highest.	Their panels ship with a dialer or nothing. We add a recurring line to a sale they already make.

CHANNEL	PARTNERS BY YR 5	ROUTE IN	WHY THEY SAY YES
Displaced DataFlow accounts	10–15	Operators disrupted by the Badger integration, reached through panel-builder referrals and trade associations.	They need a stable lift-station-first vendor during a transition they did not choose.
Contractor referral	20–25	Each live partner introduces adjacent trades — septic to pool, pool to HVAC — inside the same territory.	A partner already running the platform is a credible reference, and they are not competitors.
OEM embed	2–4	Equipment makers shipping connected panels under their own brand.	Years of app development avoided. Longest cycle, largest volume per agreement.

What a partner sale costs

Two to four field visits, a witnessed alarm test at one site, and a 90-day pilot before a fleet commitment. Modelled at **\$15K–\$40K per partner** against a **\$173K** lifetime value — 4.3× to 11.6×.

What makes it repeat

Partners expand rather than churn: they add sites from their own book at their own pace. Net revenue retention above 110% comes from site growth inside an existing agreement, not from upselling a new product.

8. Competitive position

CATEGORY	THEIR POSITION	OURS
Badger Meter / DataFlow	Lift-station SCADA absorbed into a metering suite after two mergers	Lift-station-first, fast pilot, work orders built in, aimed at operators and panel builders rather than large utilities
Legacy SCADA	Excellent for a plant; priced and scoped as a capital project	Complementary. We instrument the long tail those platforms cannot economically reach, and feed data upward
Autodialer vendors	A phone call once the failure has happened	Trend history, fleet view, automatic work orders
OEM equipment apps	One manufacturer's equipment only	One platform across mixed fleets, which is what every real site has
Generic cloud IoT	Built for IT infrastructure	Built for pumps, blowers, and chemistry, with regulatory thresholds already encoded

9. Status and risks

BUILT Platform Multi-tenant core with enforced isolation, three portals, operator HMI, edge agent, compliance reporting, predictive baselines, automated work orders.	NOT DEPLOYED Infrastructure Defined as code and validated, but no environment provisioned. First deployment is a funded milestone, not a technical unknown.	NONE YET Customers No paying customers and no pilot, so no measured acquisition cost or churn. Unit economics here are targets derived from pricing, not observations.
--	--	---

RISK	SEVERITY	RESPONSE
Partner-led model unproven. The thesis assumes service companies will resell monitoring inside their contracts. If they will not, growth reverts to direct sales and the truck-roll ceiling returns.	HIGH	The first partner deployment tests exactly this, in month one, at low cost.
No measured CAC or churn. LTV:CAC of 4–12× is derived, not observed.	HIGH	Both measurable within nine months; month-9 cohort data is the gate for any follow-on round.
Hardware margin compresses , since it is priced near cost.	MEDIUM	Not a profit centre; can move to partner-procured with no change to recurring lines.
Badger integrates faster than expected , closing the displacement window.	MEDIUM	The window accelerates year one but is not the long-term thesis.
Municipal sales cycles run long and unpredictably.	LOW	Contract operators and private sites first; towns later, using bid language written to specify condition-based monitoring.

10. The ask

INVESTMENT \$1.05M equity · funds 24 months	DEEPEST TROUGH \$819K month 18 — sizes the raise	CASH-FLOW POSITIVE Yr 4 +\$1.24M cumulative by Yr 5	FORECAST RETURN 3.6–5.7× by year 5 · 29–41% IRR
--	---	--	--

Free cash flow by year

Headcount rises with partner count, not site count — two people through year 2, nine by year 5.
Partners install; we do not. The deepest cumulative position is \$690K in year 3, inside the capital raised.

How the figure was sized

Cash is modelled monthly and the investment sized against the **deepest trough — \$819K in month 18** — plus a buffer. Costs land from month one while recurring revenue compounds late; an annual average would hide the point at which the company actually runs out of money.

Why \$1.05M funds \$1.13M of cost. Operating cost over 24 months is \$1.13M; revenue earned in those months contributes \$259K of gross profit. Capital is needed only for the gap, and only down to its deepest point — covered here with roughly 28% headroom.

USE OF FUNDS	24-MO COST	WHAT IT BUYS
Team — two senior roles, fully loaded	\$870K	Platform and engineering, at market compensation including employer taxes, benefits, and retirement — a loading of roughly 21% over base
Compliance & security	\$66K	SOC 2 Type 1, third-party penetration test, SOC 2 Type 2. Required to sell to utilities, not optional overhead
Cloud & AI	\$58K	Azure across three environments; AI development tooling — the reason two people can carry this scope
Outsourced specialist work	\$36K	Panel safety listing, edge-agent work, penetration-test remediation
Insurance, legal, tooling, travel	\$102K	E&O and cyber liability, partner and reseller agreements, partner recruitment
Total operating cost, 24 months	\$1.13M	—
Less gross profit earned in period	(\$259K)	Revenue funds part of the build
Capital required at the deepest point	\$819K	Month 18, carried by the \$1.05M investment with ~28% headroom

Forecast return

EXIT	ARR	ENTERPRISE VALUE	PROCEEDS	MULTIPLE	IRR
Year 5	\$3.75M	\$15–24M	\$3.76–5.96M	3.6–5.7×	29–41%

EXIT	ARR	ENTERPRISE VALUE	PROCEEDS	MULTIPLE	IRR
Year 10	\$11.8M	\$45–71M	\$11.3–17.7M	10.8–16.9×	27–33%

Assumes 25% equity and no dilution from later rounds, valued on a blend of ARR and revenue multiples in line with recent transactions in the category. Returns move with the ownership negotiated and with retention at the time of sale.

Milestones

MILESTONE	BY	WHY IT IS THE RIGHT GATE
Production environment live; first partner fleet monitored	Month 3	Converts the platform from built to operating
150 sites; three documented prevented failures	Month 9	First real CAC and churn data; the evidence a second partner needs
Three partners beyond the affiliate; one OEM letter of intent	Month 15	Proves the channel works with parties unrelated to us
600 sites; \$328K ARR; 8 partners	Month 24	Series A metrics, or default-alive on gross profit

Exit context

The category is consolidating and the comparables are recent and public: SmartCover acquired DataFlow Systems in 2023; Badger Meter acquired SmartCover for **\$185M** in 2025. Xylem and Veralto are acquiring in adjacent water-infrastructure software.

What those buyers acquire is **distribution into the long tail** — the hundreds of thousands of small sites their enterprise products cannot economically reach. A platform arriving with a signed contractor channel, several thousand monitored sites, and a direct reference book is that distribution, already assembled. It is materially harder to build than to buy.

PeakLogic · Business Plan & Investment Case · Prepared 2 August 2026. Financial figures are a model built from partner counts, site counts, and published pricing — not a forecast, and not audited. No customer revenue has been earned to date. Market sizing is directional. Prepared for discussion under confidentiality.
