

An intelligence layer for essential field services

PeakLogic connects the equipment your business already operates and services — pumps, treatment units, chemistry, refrigeration — to monitoring, alerts, automation, and dispatch. Issues surface early, and the right work lands in the right system. Asset visibility and risk reduction, delivered as a service.

Why essential-service operators cannot keep running blind

Essential services do not get to fail quietly. When a lift station overflows, a treatment unit stops disinfecting, or a walk-in loses temperature, the outcome is a regulator, a public health notice, or a customer lost — **not a maintenance ticket**.

Yet these are the assets nobody can see: too dispersed for a control room, too small for SCADA economics, and maintained by crews that shrink while the estate they cover grows. **The gap between what an operator is accountable for and what they can actually observe widens every year** — and every one of those failures announced itself first, in current draw, in run time, in drifting chemistry.

PeakLogic closes that gap without asking anyone to become a SCADA operator. It reads the warning, decides what matters, and puts the work in front of the person who can act on it.

What the platform actually does

Four steps. Most competitors stop after the first, which is why an alarm reaches a phone and nothing else happens.

01 · MONITOR

Connect what exists

Pumps, blowers, chemistry, level, refrigeration — mixed vendors, on one platform, over cellular or the site's own network.

02 · PREDICT

Read the warning

Per-asset baselines catch degradation — rising draw, longer cycles, drifting chemistry — weeks before the failure it becomes.

03 · DISPATCH

Land the work

An alarm becomes a work order in the servicing partner's own system, routed to whoever is accountable, not an email nobody owns.

04 · PROVE

Keep the evidence

The record a regulator, insurer or disputing customer asks for is compiled as it happens, not reconstructed from paper afterwards.

Positioning

For operators of distributed critical equipment — wastewater and septic, campus and assisted-living facilities, food service, pools, and light commercial mechanical — who **cannot justify a traditional SCADA deployment but cannot absorb the failures either**, PeakLogic is a predictive analytics and asset-management platform that converts unplanned failure into scheduled work.

Autodialers call once the overflow has happened. SCADA is priced and scoped as a capital project. PeakLogic reaches these sites a third way — **through the service contractors already maintaining them** — so it arrives with no integration project and pays for itself out of emergencies that no longer occur.

How it reaches the market

The distribution model is the part of this business that is genuinely difficult to copy.

The constraint is truck rolls, not demand

Every competitor's growth is capped by how many sites their own people can drive to. We remove that cap by making the service contractor the channel, so **customer acquisition costs a partner signature rather than a site visit**. One partner with 90 sites is worth ninety direct sales — and they install on visits already scheduled.

Direct sales run alongside it

Some operators run their own crews, and institutional campuses have no contractor in the middle. Direct is the smaller book by site count but the higher-value one per site, and it produces the reference customers that make a channel conversation credible. **Roughly 39% of recurring revenue is direct** across the plan.

The problem, and what it costs

Across wastewater, septic, pools, HVAC, and cold chain the operating model is identical: assets run until they fail or somebody complains. The cost is not the repair — it is the consequence.

TODAY	WHAT IT COSTS THE OPERATOR	WHAT MONITORING CHANGES
Phone autodialer calls at high water	Sanitary sewer overflow, fines, emergency crews	Rising-level trend flags the problem days earlier
Service trucks run on a calendar	Visits that were not needed; failures between visits	Visits triggered by condition, not the month
Failed blower found on a routine visit	Failed inspection, treatment out of compliance	Power and runtime drift raises a work order first
Full SCADA quoted, or nothing at all	Small sites get nothing, indefinitely	A standard kit and a subscription, no integrator project

The pattern matters more than any one vertical: the same platform serves all of them, because the failure being prevented is always the same shape — **an asset degrading unobserved between scheduled visits**.

Why now — and why the window is dated

Four forces, ranked by how much of the market each one moves. Only the second is time-boxed — but it is the one that determines whether this is the right twenty-four months.

01

Market creation, not displacement

At most of these sites, the incumbent is nothing at all

"Displacement" overstates it. The overwhelming majority of lift stations, treatment units, and light commercial mechanical rooms have **no monitoring at all, or a phone autodialer that calls once the failure has happened**. There is no vendor to unseat, no contract to buy out, and nothing to rip out.

That is the stronger position: no switching friction, no incumbent defending an account, and a buyer adopting for the first time rather than being asked to admit an earlier decision was wrong. Where we *do* displace, it is narrow — ageing autodialers, and OEM apps that see only their own manufacturer's equipment.

02

Time-boxed

Consolidation has orphaned the installer channel

DataFlow Systems, the dominant lift-station monitoring vendor, was acquired by SmartCover in 2023 and SmartCover by Badger Meter in 2025 for **\$185M**. The product line is being folded into Badger's BlueEdge suite: contracts, billing, support contacts, and domains are all moving, and small-to-midsized lift-station work receives the least attention during an integration of that size.

This is both a displacement and a partnership opening, and the partnership half is the durable one. **Panel builders are the distribution channel, not the competition**. They already sell to towns and operators, most of their panels still ship with a dialer or nothing, and they want recurring revenue without building cloud software. This window closes when Badger finishes integrating — the channel relationships formed during the disruption are what outlast it.

03

Structural

A modernisation cycle is arriving whether operators are ready or not

Three forces are converging on one estate. The installed base of dialers and custom relay panels is **reaching end of life** just as the cellular and sensing hardware to replace it has fallen to a fraction of its former cost. Meanwhile the workforce that carried this knowledge in their heads is retiring, and the crews replacing them are smaller and cover more sites.

The result is an operator being asked to supervise a growing estate with fewer people and ageing instrumentation — and increasingly being asked by their own board, insurer or council to **evidence** that they can. Modernisation stops being discretionary at that point. The question becomes what they modernise onto.

04

Now a procurement gate

Security has moved from a checkbox to a condition of sale

The 2026 coordinated intrusions against US water utilities changed what a security review is for. Legacy autodialers and one-off control panels have essentially no security posture to present: no patching story, no audit trail, no way to answer what a compromised device could reach. Operators are now being asked those questions by regulators, insurers, and their own boards, and many cannot answer them.

Our position here is a commercial asset rather than an engineering detail, and it has two parts. **Today the platform is read-only by construction** — no code path issues a device command and no permission grants one. For a utility security reviewer that is a materially shorter conversation than any competitor can offer, and it removes the single largest objection to connecting a plant to anything.

Control is on the roadmap, because operators will eventually want remote reset, setpoint change and shutoff, and a monitoring-only product would cede that ground. The advantage is not that we will never actuate — it is the order in which we get to build. The authorisation model, the safety interlocks, and the audit trail are being designed before a single command path exists. Safety-critical actions stay local to the equipment and trip on their own sensor reading without waiting on the cloud; the platform provides override, evidence, and accountability rather than the trip itself.

Every incumbent in this category is attempting the reverse — retrofitting a security posture onto control systems designed before any of this was a threat. That is substantially harder, and it is why a security review is a competitive event for us rather than an obstacle.

Drivers 3 and 4 are the ones that make this a market rather than a niche — they apply to every site in it, not just those a competitor happens to be neglecting. Driver 2 is what makes the next twenty-four months the right ones to move in.

Business model

Three revenue lines, deliberately weighted so that the durable one is the one that compounds.

LINE	WHO PAYS	PRICE	ROLE IN THE BUSINESS
Partner platform fee	Service company	\$250-\$4,000 / mo by fleet size	The durable line. Buys the partner a business system — dispatch, work orders, a branded customer portal, compliance evidence.
Per-site monitoring	Service company, marked up to their customer	\$18-\$25 / site / mo	Scales with the partner's own book. They resell it inside contracts they already hold.
Direct monitoring	Site owner, sold by us	\$38 / site / mo	No partner margin to share, so we keep the full rate. Higher acquisition cost per site, and the source of reference customers a channel sale leans on.
Hardware & commissioning	Site owner, via partner or direct	~\$1,800 / site	Cost-plus, ~20% Deliberately not a profit centre — a customer-acquisition cost we recover, priced to remove the barrier to the first site.
Institutional campuses (assisted living, healthcare) at ~\$25K/yr are always direct — larger, slower, and far higher value per logo.			

Why the partner, and not the site owner

A site owner buys monitoring once, reluctantly, and churns when budgets tighten. A service company buys it to **protect margin on contracts they already have** — fewer emergency callouts, fewer wasted visits, evidence when a customer disputes work. That is a operating-cost decision, not a capital one, and it renews because the alternative is going back to driving blind.

Financial model

Built from partner and site counts against published pricing. Every figure below is arithmetic from those two inputs — no top-down market share assumptions.

RECURRING PER SITE

\$264

channel · \$456 direct

\$264

channel · \$456 direct

HARDWARE PER SITE

\$1,800

one-time, ~20% margin

\$1,800

one-time, ~20% margin

SITES PER PARTNER

~90

at maturity

~90

at maturity

7-YR SITE VALUE

\$3.6K

recurring + one hardware cycle

\$3.6K

recurring + one hardware cycle

YEAR	PARTNERS	SITES	OF WHICH DIRECT	EXIT ARR	REVENUE	GROSS PROFIT
1	3	150	30	\$97K	\$319K	\$94K
2	8	600	120	\$328K	\$1.02M	\$337K
3	20	1,800	350	\$922K	\$2.79M	\$945K
4	40	4,000	800	\$1.97M	\$5.41M	\$1.98M
5	70	8,000	1,600	\$3.75M	\$10.06M	\$3.78M
10	190	27,000	5,400	\$11.82M	\$15.78M	\$10.15M

Recurring revenue is recognised on the average of opening and closing base, not the exit run-rate — the most common way early-stage models overstate year one.

Is 600 sites in two years actually deliverable?

As a single number it reads like more than one installation every working day for two years, which no two-person company could staff. That is the wrong unit. The correct one:

YEAR	CHANNEL SITES ADDED	PARTNERS	PER PARTNER / YEAR	PER PARTNER / WEEK
1	120	3	40	0.83
2	360	8	45	0.94
3	970	20	49	1.01
5	3,200	70	46	0.95

48 working weeks. Channel sites only — partners install those on visits already scheduled. The direct book is installed by us and is an order of magnitude smaller.

Slightly under one site per partner per week, every year of the plan. A service company with fifty accounts adding monitoring to one of them a week is not a stretch target — it is a slow adoption curve, and it never rises. The number looks large only because it is the sum of many small, independent efforts, which is precisely what the channel model is for.

The real risk here is **not** installation capacity. It is partner recruitment: 8 signed partners by month 24, then 70 by year five. That is the number to challenge, and it is addressed in Risks below.

Revenue mix, and why gross profit is the better measure

Revenue is hardware-heavy in the early years — **only 21% of Year 3 revenue is recurring**, because every new site carries ~\$1,800 of equipment. Presented as SaaS, that would be misleading, and it is exactly the flaw we found in the prior forecasts.

So we report **gross profit mix instead of revenue mix**. Hardware runs at ~20% margin and software at ~82%, which means recurring gross profit overtakes hardware in **Year 2** and reaches 60% by Year 5, 81% by Year 8. Revenue makes this look like an equipment business; profit shows it is not.

How we acquire the customers

Eight partners by month 24 and seventy by year five is the number that carries the plan. Here is where they come from.

CHANNEL	PARTNERS BY YR 5	ROUTE IN	WHY THEY SAY YES
Affiliate operator	1	Already held. First fleet live in month 3.	No sales cycle. Produces the case studies every other conversation needs.
Control-panel builders	25–30	Direct outreach to shops serving wastewater and light commercial, concentrated in states with the densest lift-station counts.	Their panels ship with a dialer or nothing. We add a recurring line to a sale they already make, with no cloud software to build.
Displaced DataFlow accounts	10–15	Operators and builders disrupted by the Badger integration, reached through panel-builder referrals and trade associations.	They need a stable lift-station-first vendor during a transition they did not choose.
Service-contractor referral	20–25	Each live partner introduces adjacent trades — septic to pool, pool to HVAC — inside the same territory.	A partner already running the platform is a credible reference to a peer, and they are not competitors.
OEM embed	2–4	Equipment makers shipping connected panels under their own brand.	Years of app development avoided. Longest cycle, largest volume per agreement.

Direct sites and institutional campuses are sold by us, not through these channels — roughly 39% of recurring revenue.

What a partner sale costs

Two to four field visits, a witnessed alarm test at one site, and a 90-day pilot before a fleet commitment. Modelled at **\$15K–\$40K per partner** against a **\$173K** lifetime value — 4.3× to 11.6×. No partner requires a sales team we do not have.

What makes it repeat

Partners expand rather than churn: they add sites from their own book at their own pace. Net revenue retention above 110% is the target, and it comes from site growth inside an existing agreement, not from upselling a new product.

Competitive position

CATEGORY	THEIR POSITION	OURS
Badger Meter / DataFlow	Lift-station SCADA absorbed into a metering suite after two mergers	Lift-station-first, fast pilot, work orders built in, aimed at operators and panel builders rather than large utilities
Legacy SCADA (Ignition, VTScada, Wonderware)	Excellent for a plant; priced and scoped as a capital project	Complementary. We instrument the long tail those platforms cannot economically reach, and feed data upward into them where they exist
Autodialer vendors	A phone call once the failure has happened	Trend history, fleet view, automatic work orders
OEM equipment apps	One manufacturer's equipment only	One platform across mixed fleets, which is what every real site actually has
Generic cloud IoT	Built for IT infrastructure	Built for pumps, blowers, and chemistry, with the regulatory thresholds already encoded

Security as a commercial asset, not a compliance cost

Following the 2026 coordinated intrusions against US water utilities, security review is now a procurement gate rather than a formality. The platform is architected so that **it is read-only by construction today** — no code path issues a device command, and no permission grants one. Control is roadmapped, but the authorisation model, interlocks, and audit trail are being designed before any command path exists, and safety-critical trips stay local to the equipment. Competitors are retrofitting security onto control systems built decades earlier, which is the harder direction.

Status — what exists today

Stated plainly, because the gap between built and deployed is the first thing diligence establishes.

Built

Platform

Multi-tenant core with enforced data isolation, three portals, operator HMI, edge agent, compliance reporting, predictive baselines, automated work orders.

Not deployed

Infrastructure

Cloud infrastructure is defined as code and validated, but no environment has been provisioned. First deployment is a funded milestone, not a technical unknown.

None yet

Customers

No paying customers, no pilot, and therefore no measured acquisition cost or churn. Every unit-economic figure here is a target derived from pricing, not an observation.

The channel asset

An affiliated operating company — a septic and wastewater service business with an established regional fleet — provides the first partner deployment without a sales cycle. This converts the hardest problem in the plan (proving the model on real sites, with real technicians, against real equipment) into an internal scheduling exercise. It is the single largest de-risking factor in this proposal, and no competitor entering this market has an equivalent.

Risks

Ranked by what would actually damage the plan, not by what is easiest to mitigate.

RISK	SEVERITY	RESPONSE
Partner-led model unproven. The entire thesis assumes service companies will resell monitoring inside their contracts. If they will not, growth reverts to direct sales and the truck-roll ceiling returns.	High	The first partner deployment tests exactly this, in month one, at low cost. If attach rates disappoint, we learn it before the raise is spent.
No measured CAC or churn. LTV:CAC of 4–12× is derived, not observed.	High	Both become measurable within 9 months. We would treat month-9 cohort data as the gate for any follow-on round.
Hardware margin compresses or supply moves against us, since it is priced near cost.	Medium	Hardware is explicitly not a profit centre; it can move to partner-procured with no change to the recurring lines.
Badger integrates faster than expected , closing the displacement window.	Medium	The window accelerates year one but is not the long-term thesis. Panel-builder channel economics hold regardless.
Municipal sales cycles run long and unpredictably.	Low	Contract operators and private sites first; towns later, using bid language written to specify condition-based monitoring.

The ask

INVESTMENT

\$1.05M

equity · funds 24 months

DEEPEST TROUGH

\$819K

month 18 — the figure that sizes it

MONTH-24 ARR

\$328K

8 partners · 600 sites

FORECAST RETURN

3.6–5.7×

by year 5 · 29–41% IRR

CASH-FLOW POSITIVE

Yr 4

+\$1.24M cumulative by year 5

How the figure was sized

Cash is modelled monthly and the investment sized against the **deepest trough — \$819K in month 18** — plus a buffer. Costs land from month one while recurring revenue compounds late; an annual average would hide the point at which the company actually runs out of money.

Why \$1.05M funds \$1.13M of cost. Operating cost over 24 months is \$1.13M; revenue earned in those months contributes **\$259K of gross profit**. Capital is needed only for the gap, and only down to its deepest point — covered here with roughly 28% headroom.

The team is **two senior roles** — platform and engineering — rising to nine by year five. Development is AI-assisted and partners perform installation, so headcount tracks partner count rather than site count. Staffing an installation team would rebuild the constraint this model exists to remove.

USE OF FUNDS	24-MO COST	WHAT IT BUYS
Team — two senior roles, fully loaded	\$870K	Platform and engineering. Costed at market compensation including employer taxes, benefits, and retirement — a loading of roughly 21% over base, and the line most often under-provisioned in a lean plan
Compliance & security	\$66K	SOC 2 Type 1 (m9), third-party penetration test (m11), SOC 2 Type 2 (m21). Required to sell to utilities, not optional overhead
Cloud & AI	\$58K	Azure across three environments, scaling with sites; AI development tooling — the reason two people can carry this scope
Outsourced specialist work	\$36K	Panel safety listing, edge-agent work, penetration-test remediation — the work AI assistance cannot do
Insurance, legal, tooling, travel	\$102K	E&O and cyber liability (a contract prerequisite for utility work), partner and reseller agreements, partner recruitment travel
Hardware working capital	float	Kits are purchased before partners pay. Self-correcting on ~75-day terms, but the raise must carry the float
Total operating cost, 24 months	\$1.13M	—
Less gross profit earned in the same period	(\$259K)	Revenue funds part of the build; only the gap needs capital
Capital required at the deepest point	\$819K	Month 18. The investment of \$1.05M carries this with ~28% headroom

CASH FLOW	YR 1	YR 2	YR 3	YR 4	YR 5
Gross profit	\$94K	\$337K	\$945K	\$1.98M	\$3.78M
Operating cost	\$513K	\$531K	\$1.02M	\$1.54M	\$2.30M
Free cash flow	(\$419K)	(\$195K)	(\$76K)	\$442K	\$1.49M
Cumulative	(\$419K)	(\$614K)	(\$690K)	(\$248K)	\$1.24M
Headcount rises with partner count, not site count — 2 people through year 2, 9 by year 5. Partners install; we do not. The deepest cumulative position is \$690K in year 3, inside the capital raised.					

FORECAST RETURN ON \$1.05M	PROCEEDS	MULTIPLE	IRR
Exit at year 5 — ARR \$3.75M	\$3.76M – \$5.96M	3.6× – 5.7×	29% – 41%
Exit at year 10 — ARR \$11.8M	\$11.3M – \$17.7M	10.8× – 16.9×	27% – 33%
Assumes 25% equity, no dilution from later rounds, and a blend of ARR and revenue multiples in line with recent transactions in the category. Returns move with the ownership negotiated and with retention at the time of sale.			

MILESTONE	BY	WHY IT IS THE RIGHT GATE
Production environment live; first partner fleet monitored	Month 3	Converts the platform from built to operating
150 sites; three documented prevented failures	Month 9	First real CAC and churn data; the evidence a second partner needs
Three partners beyond the affiliate; one OEM letter of intent	Month 15	Proves the channel works with parties who are not related to us
600 sites; \$305K ARR; 8 partners	Month 24	Series A metrics, or default-alive on gross profit

SCENARIO	RAISE	TRADE-OFF
Lean — reduced compensation through year one, stepping up in year two	\$900K	Lowest dilution, but two senior operators carry below-market pay through the hardest year of the plan
Recommended — market compensation from month one	\$1.05M	Removes the compensation question from a two-person company where losing either person ends the plan
Buffered — market compensation plus a six-month ramp slip	\$1.15M	Absorbs the most likely failure mode: partner signing takes longer than modelled
Every scenario reaches the same month-24 position: 8 partners, 600 sites, \$305K ARR, monthly net positive.		

EXIT	ARR	REVENUE	ON ARR	ON REVENUE	ENTERPRISE VALUE
Year 5 sub-scale, growing fast	\$3.75M	\$10.06M	4–6×	1.5–2.5×	\$15–24M
Year 10 proven retention, cleaner mix	\$11.82M	\$15.78M	5–8×	2–3×	\$45–71M
Valued on both lenses because a hybrid hardware-and-software business is argued both ways; the figure shown is the blend. Multiples follow the metrics at the time of sale.					

Why a strategic buyer pays it

This category is actively consolidating and the comparables are recent and public: SmartCover acquired DataFlow Systems (2023); Badger Meter acquired SmartCover for **\$185M** (2025). Xylem and Veralto are acquiring in adjacent water-infrastructure software.

What those buyers are acquiring is **distribution into the long tail** — the hundreds of thousands of small sites their enterprise products cannot economically reach. A platform arriving with a signed contractor channel, several thousand monitored sites and a direct reference book is that distribution, already assembled. It is materially harder to build than to buy, which is what supports the upper half of the ranges above.

Financial figures are a model built from partner counts, site counts and published pricing — not a forecast, and not audited. No customer revenue has been earned to date. Market sizing is directional. Prepared for discussion under confidentiality.
